

Who is doing more work?

3 students

1. Calvin is hold a stack of books motionless.
2. Alvin is lifting a book up and down.
3. Helen is walking, holding a book.

Alvin is fighting gravity - changes in energy - force is moving

$$W=Fs$$

work, in Joules, $J=Nm$

F is the force, in N

s is displacement (d is the symbol in book), in m .

when the force is in the direction of displacement.

Work is the vector dot product of force and displacement.

Work is a scalar - no direction.

given this definition, who is doing work?

Calvin - large force but no displacement, so Calvin does no work.

Helen - The force on the book is perpendicular to the displacement, so she does no work.

Alvin - does positive work lifting the book, negative work lowering the book (F is opposite s) so the net work is 0

so students don't do work.

Work can also be defined/discussed as the change in energy.

Work energy theorem

$$W = \Delta \text{Energy}$$

What is energy?

energy is the ability to do work.

Energy is conserved.

physical work = Fs

Power is the rate of doing work or the rate of change in energy.

$$P = \Delta W / \Delta t$$

units, Watt, $W = J/s$

horsepower, hp = 746W

eg. 1. A 50.0 kg student runs up 23 stairs 0.27m wide and 0.12m high in 3.0 s.

a) what is the force of gravity on the student?

$$F_g = mg = 50.0\text{kg} \times 9.81\text{N/kg} = 50 \times 9.81 = 490.5 \text{ N}$$

490N

a) What is the total change in height of the stairs?

$$23 \times 0.12 = 2.76 \text{ m} = 2.8\text{m}$$

a) What is the work done by the student against gravity?

$$W = Fs = 490.5 \times 2.76 = 1,353.78 = 1.4 \times 10^3 \text{ J}$$

a) What is the work done by gravity?

$$W = -1.4 \times 10^3 \text{ J}$$

F is opposite s, so negative

a) What is the work done by the normal force?

$$W = 0$$

doesn't move

b) What is the power of the student, in W, in hp?

$$P = W/t = 1,353.78/3 = 451.26 = 450\text{W}$$

$$451.26/746 = 0.6049 = 0.60\text{hp}$$

2. A 100W light bulb is left on 8.0 hours a day for a year. BC hydro charges about 12 cents per kilowatt-hour. How much does it cost for high efficiency bulbs that give off equivalent light

kilowatt-hour. How much does it cost for high efficiency bulbs that give off equivalent light using only 25W?

3. Run stairs, calculate your power.

1a) $p=mv = 0.12 \text{ or } 0.18\text{kg} \times 15\text{m/s} = 1.80\text{kgm/s}$
or 2.7kgm/s

a) $\Delta p = p_f - p_i = mv_f - mv_i = -0.12\text{kgm/s}$
or -0.18kgm/s

b) $\Delta p = p_f - p_i = mv_f - mv_i = -1.80\text{kgm/s}$ or -2.7kgm/s

c) $\Delta p = p_f - p_i = mv_f - mv_i = -3.4\text{kgm/s}$ or -5.2kgm/s

d) $F_{\text{net}} = \Delta p / \Delta t = -3.4 \text{ or } -5.2 / 0.020\text{s}$
 $= -170\text{N}$ or -260N

1. a) total momentum before the explosion = total momentum after

$$0 = m_a v_a + m_b v_b$$

$$v_b = -m_a v_a / m_b = -1.3\text{m/s} \text{ or } -1.6\text{m/s}$$

1.3m/s opposite the other cart

a) $F = \Delta p / \Delta t$ internal force between the carts, so just look at one cart

$$F = 3\text{kg} \times 1.3\text{m/s} / 0.20\text{s} = 2\text{kg} \times 2\text{m/s} / 0.02\text{s} = 20\text{N}$$

$$F = 5\text{kg} \times 1.6\text{m/s} / 0.20\text{s} = 2\text{kg} \times 4\text{m/s} / 0.02\text{s} = 40\text{N}$$

1. total momentum before = total momentum after
 $0.035\text{kg} \times 350\text{m/s} + 0 = (0.035\text{kg} + 0.35 \text{ or } 0.45\text{kg})v$

$$v = 25.3 \text{ m/s or } 31.8 \text{ m/s}$$

2. $F\Delta t = \Delta p$ = area under the graph

$$85 \text{ N} \times 20 \text{ s} = 1700 \text{ Ns} = mv_f - mv_i$$

$$v_f = [1700 \text{ Ns} + (4 \text{ or } 3 \text{ kg} \times 14 \text{ m/s})] / 4 \text{ or } 3 \text{ kg}$$

$$439 \text{ m/s or } 581 \text{ m/s}$$

$$4.4 \times 10^2 \text{ m/s or } 5.8 \times 10^2 \text{ m/s}$$
